

INSTANT EXTINGUISHERS FOR YOUR SAFETY

Fireantigen.com

Safety in houses and private environments

Fire Antigen represents an important step forward in protection against fires in house. The World Health Organization reports alarming data about mortality due to fires in house, estimating about 1.5 million victims every year and identifying children and seniors as most affected. Now it is sufficient to place Fire Antigen in the areas where there is a potential risk or burn, like kitchens and outlet boxes, to avoid domestic fires and give an important contribute to everyone's safety.

What is Fire Antigen?

Fire Antigen surpasses the philosophy of most traditional firefighting technologies; while normal fire extinguishers are developed to treat the fire when it has already become a threat for humans, instant extinguishers work earlier, when flames are still limited. It is a fully-automatic product, and therefore it requires no human intervention at any time, it does not work using electronic mechanisms, which may eventually fail, and requires no periodic maintenance, with its 5-year warranty. Fire Antigen may also reveal as a fundamental life-saving tool, because when a fire has already raised it can be used to attack flames directly and track a safe way out, raising by more than double the chances to survive. For further information, please take a look at our website www.fireantigen.com. Thank you for your interest in Fire Antigen.

Buildings, condos and residential areas

Safety in buildings and residential areas

Fire Antigen acts automatically and suddenly when a fire raise, and this makes instant extinguishers a vital support inside non-protected, unattended common areas of buildings. The highest risk of fire in a building is commonly determined by centralized boilers and heaters, lift rooms, or also areas close to gas and electricity connections; such places are normally 100% unattended and not visited by anyone, so it is very difficult to notice and prevent malfunctions: the consequence is that in case of fire people can understand the risk when flames are already very intense and it's too late to avoid disasters and very dangerous situations.

Industrial and production environments

Safety in industrial and production environments

Fire Antigen is a must-have product to put in safety industrial and warehousing areas, because it allows to quickly cut off fire even before it begins raising, reducing dramatically damages to humans and things. The instant extinguisher can be also installed into places that cannot be normally reached, and may be improved with smoke or heat sensors, so that Fire Antigen can turn off fires even before flames appear. Instant extinguishers are also an outstanding solution for fire fighting when fires have already raised, since their special fire-retardant formulas help to limit oxygen and refresh the surrounding area.

Safety into offices and server rooms

All the most important countries worldwide are strengthening minimum mandatory safety measures in job places, where still nowadays occur the majority of deaths for accidental causes. Fires are definitely among the most important risk scenarios, but not rarely it is not possible to install very complex firefighting infrastructures into every room. Fire Antigen is the solution, because its special powder-based dielectric formula cuts off fire suddenly without conducting electricity; in addition, the product can be enhanced with smoke or heat sensors that advance the action even before flames appear. Fire Antigen ensures a totally automatic and fast control of fire that may save lives and company information whose value is potentially incalculable.

Safety for professional transporters

Truck loads are among the most dangerous elements that may cause a fire on a heavy vehicle; but also bad pneumatic tyres, short circuits, various accidents can truly represent a threat for professionals of transport. In addition, when a fire raise inside these vehicles, nothing can be done concretely to treat fire and truckload is often irrevocably destroyed. Fire Antigen is the product that can help preventing such disasters and risks for human beings: it can be safely placed with truckload, in case of fire it activates automatically, releasing a special flame-retardant formula that cuts off fire, refreshes the area and leaves a film that avoids flame reactivation. Fire Antigen can be also used to attack fire directly in addition to traditional extinguishers.

Safety for cars and caravans

Fires that occur while we are inside a car or a caravan are definitely among the most dangerous for people; this because at the same time we are in a very narrow place and, in almost 100% cases, we do not have any fire fighting product to use immediately. Fire Antigen does its best in these kinds of situations, because it acts suddenly turning off fire at the beginning; in addition, its special polyvalent formula is perfect to treat all main fire types, so it is very efficient with all hydrocarbon-based products, as well as wood or rubber. Fire Antigen is also a must-have equipment to prevent forest fires, that often grow up close to caravan camps especially since not rarely they miss any fire fighting measures.

What is Fire Antigen?

Fire Antigen surpasses the philosophy of most traditional firefighting technologies; while normal fire extinguishers are developed to treat the fire when it has already become a threat for humans, instant extinguishers work earlier, when flames are still limited. It is a fully-automatic product, and therefore it requires no human intervention at any time, it does not work using electronic mechanisms, which may eventually fail, and requires no periodic maintenance, with its 5-year warranty.
